# INCREASE

Nuclei • Management • Wintering

# Keys to Solid Beekeeping

- Constantly evaluate honey productions from bee yards
- Push your mean honey production to be better all of the time
- Understand that colony loss is a reality accept that 25% loss may be normal
- Use increases (splits) to either keep number of colonies stable through time, or to increase the size of your operation

## **Definitions**

► A <u>split</u> is separating the two hive bodies from a colony to make two colonies

A <u>nuc</u> is a fully balanced but miniature colony

An <u>increase</u> is simply adding to the number of colonies that you manage

## Why Make Splits and Nucs?

- ▶ To grow your business
- ▶ To replace winter losses
- ▶ Foolproof requeening
- Management tool for swarm prevention
- Queen rearing / mating nuc

## Things Needed to Make Splits

- Strong and productive colonies (A and B students) coming out of the winter are kept as your honey primary producing colonies (manage these for swarming)
- Poorer colonies your C students and lower are all candidates for splits
- Queens or queen cells
- Nucleus hive bodies (or other hive sizes)
- A location for new nucs that is far from source yard (> 3 miles)

## **Basic Rules to Making Nucs**

Make them in middle of the day when field bees are out of the hive

- Keep the nuc in progress protected from the sun to avoid baking uncapped brood
- Use a minimum amount of smoke

Nucs should have reduced entrances and/or robber screens

#### Two colonies from one hive

#### Side by Side Splits

- ▶ Put 2 floors near original hive
- Put empty box on each floor
- Put half the food into each box
- Put half the brood into each box
- ▶ One box gets the queen
- Other box gets a mated queen or a mature queen cell

#### Two colonies from one hive

#### Walk Away Splits

- Split into equal halves as in side-by-side splits
- Move from original hive site (miles)
- Leave alone for two weeks
- Queenless halve will raise a queen

#### Varying Broodless Periods

- ► For a split raising a <u>queen from young brood</u>: it will take 12-16 days for queen to emerge, another 6-8 days to mate, and 3-5 days to lay eggs after mating
- Total period without new brood production will be at least 21 days
- RISK: The bee population diminishes too fast!

#### Varying Broodless Periods

- ► For a split raising a <u>queen from a mature cell</u>: it will take 2 days for queen to emerge, another 6-8 days to mate, and 3-5 days to lay eggs after mating
- ► Total period without new brood production will be at least 11-15 days
- RISK: The bee population diminishes, but not as dramatic as previous method.

#### Varying Broodless Periods

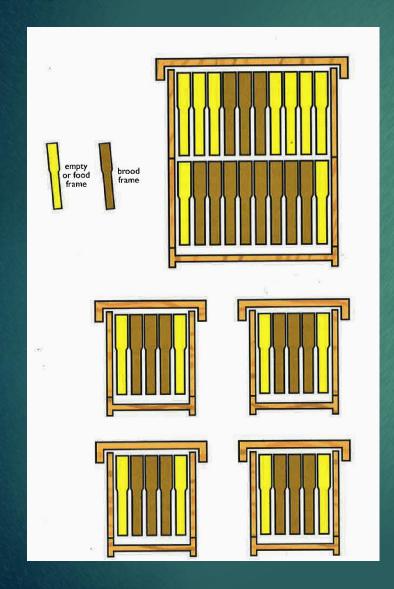

- ► For a split given a <u>caged mated queen</u>: it will take 2-5 days for candy release from cage, another 3-5 days days to lay eggs
- ► Total period without new brood production will be at least 5-10 days

RISK: Hand release queens to ensure acceptance!

#### **How to Make Nucs**

- ▶ I encourage you to make nucs with 3 frames of brood (best chance of surviving)
- ► Fill out nuc with at least one heavy honey and pollen frame and an empty comb
- Unit should be fed 50:50 syrup and grown into two full sized brood chambers by late spring or early summer
- ▶ Alternate: Empty combs and a feeder

## Up to 4 Nucs from One Colony

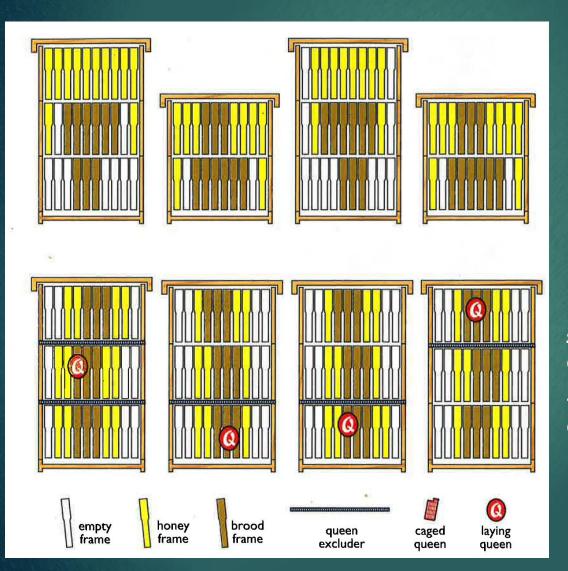

- 1 frame of brood for mating nuc
- 2 frames of brood for an increase colony
- 3 frames to make a split that should produce honey

#### How to Make Nucs for Sale

- ► Add 1 frame of honey
- Add 2 frames of brood with adhering bees
- Add a frame of foundation and a division board feeder full of syrup
- Introduce a queen cell; wait two weeks
- Remove feeder and add heavy honey from another colony
- Sell the nuc

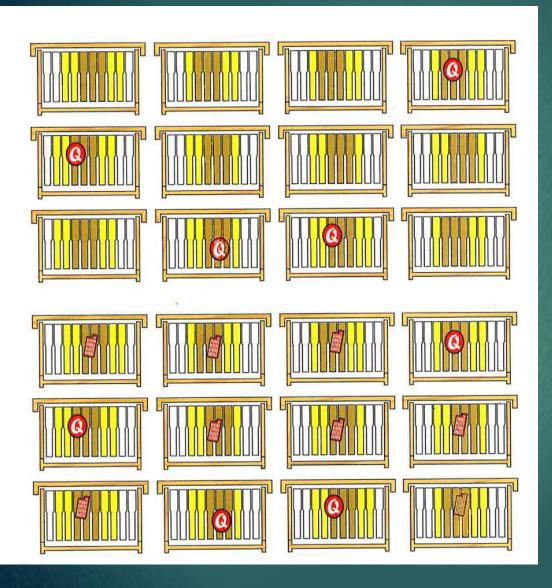

# Texas Set-Off Splits

colonies of varying strength in the spring time

arrangement after workup: each box has 3 frames brood, 3 frames of honey/pollen, and excluders used to pin queen

# Texas Set-Off Splits

Night after workup: all boxes placed onto bottom boards

Next day: caged queens placed into queenless units

## Your First Time Making Splits

- Consider only doing it in spring just before swarm season
- Splits usually respond well to natural flows and can grow to a good size and even produce a surplus honey
- Although nucs can be made in the summer, the care is much more involved.
- Wintering nucs is possible, but there is a certain finesse to being successful.
- Make your first few years of increase during the spring and learn to be good at it; then experiment with other seasons.

## **Seasonal Considerations**

Attributes	Early	Swarm	Summer
Colony Strength	Lowest bee and brood levels of season	Excellent bee and brood numbers; Swarm season	Strong, but brood rearing declining
Weather Conditions	May be poor	Usually favorable	Extreme heat possible
Drone Numbers	Unpredictable; Early drones may be scarce	Maximum for season	Reduced number and viability
Mites and Pests	Lowest mite number	Increasing varroa & SHB	Highest varroa; Highest SHB

## Spring Nuc Management

- Usually made during nectar flow (2 frames of brood recommended)
- Spring nucs are ideal for learning how to grow colonies
- Add 2<sup>nd</sup> box, or expand to 10-frame equipment as soon as bee population warrants
- If not sold, given away, or not needed in your operation, it can be overwintered

## Summer Nuc Management

- Source colony fed a 1:1 sugar syrup one week prior to splitting
- Nucs should be given 3 frames brood (older larvae or capped). No eggs or very young larvae (likely cannibalized)
- Nuc is fed 1:1 syrup to stimulate nectar flow and support it during growth
- Queen introduction much more difficult
- Can be overwintered as replacement for winter losses

#### **Summer Nucs for Winter**

- Start nuc with 3 frames of brood most of these frames will also have pollen and honey.
- One frame should be eggs and young larvae; the two remaining frames should contain honey and pollen (and placed on the outside positions in the nuc).
- When the nuc size has grown, add a nuc super with 5 fully drawn combs.
- These 5 combs need to be fully capped before winter; feed in autumn if necessary; monitor nucs throughout winter and feed fondant or candy boards as needed.
